Date of test

The test was conducted on 30-11-2023.

Purpose of test

Examination of the fire performance of a façade using the large fire exposure.

The test specimen has been subjected to a fire test in accordance with the following draft standards:

ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE

Draft revision 6

Draft Date: 2022 – 11 – 18

The test was not performed accredited.

Test specimen

The trade name and sponsors identification mark are stated below:

Trade name: None

Identification mark: None

The components for the test specimen were delivered and mounted by the sponsor.

Drawings and description

Details of the construction are shown in the enclosed documentation as stated below:

The documentation is supplied and stamped by DBI - Danish Institute of Fire and Security Technology

Description

The test specimen consisted of the components described in the following. DBI inspected the components during mounting, the test and after the test.

The sponsor carried out the selection of the products for the test specimen as well as the mounting.

| | | | | |
|--------------------|-----------------|---------------------|---------------------|---|
| External measures: | Height: 9197 mm | Main width: 3510 mm | Wing width: 1546 mm | Thickness: 351 mm With flame deflector: 654 mm |
|--------------------|-----------------|---------------------|---------------------|---|

The test specimen was a ventilated façade made of horizontal wood boards, mounted on vertical formwork.

Flame deflector profiles were installed above fire chamber and windows on the main facade.

The build-up of the façade system is shown on the attached drawings, supplied by the sponsor. The construction of the facade is described from the first layer on the aerated concrete frame.

First Layer: The first layer consisted of prefabricated cassettes which were built from untreated construction wood C24 with dimensions 45 x 245 mm with a nominal density of 480 kg/m³. The prefabricated cassettes were mounted vertically with a distance of approx. 550 mm. The construction wood C24 cassettes protruded approximately 1627 mm above the aerated concrete façade rig. There were 8 cassettes in total, and they were mounted with 550 mm in between the horizontal gaps. See drawing No. TU_ST3_No1.

The backside of the prefabricated cassettes was closed with 15 mm OSB board with a nominal density of 550 kg/m³.

Fixing of first layer: The construction woods C24 were fixed to each other with steel angles designated Paslode 90 x 90 x 65 with screws designated Paslode DS413 4.0 x 40 mm at 4 corners of the cassette. The T- conjunctions of the construction woods were fixed with nails designated TJEP GR 3.1 x 90 mm with a c/c distance of 20 mm.

The OSB boards were fixed on the prefabricated cassette with nail designated Tjep ZE 2.5 x 65 ring. The c/c distance of the nails was approx. 150 mm.

The cassettes were put on 2 ACW 155 Simpson strong-tie console bracket which were fixed to the aerated concrete frame with 4 screws designated Spit ACS CSK ø8 x 90/30 mm. One screw designated Paslode 5.0 x 40 mm was used to connect the cassette and each console bracket. All the other edges of prefabricated cassettes were fixed to the aerated concrete with steel angles designated Paslode 90 x 90 x 65. 4 screws designated Paslode 5.0 x 40 mm were used to connect the angle to the wood. The angles were fixed to the aerated concrete with one screw designated Spit ACS CSK ø8 x 90/30 mm. The angles were mounted with a c/c distance of approx. 600 mm in

horizontal and 900 mm in vertical. The gap between the cassettes and the concrete was approx. 10 mm.

Gaps in the first layer: The gaps between 2 cassettes were filled with wood and insulation. On the top of the gap, construction wood C24 with dimensions of 45 x 245 mm and 45 x 145 mm were mounted on the upper prefabricated cassette. On the bottom, the construction wood with dimensions of 45 x 195 mm, 45 x 100 mm and 45 x 70 mm were mounted on the lower prefabricated cassette. The insulation designated Rockwool flexibatts 37 with the thickness of 95 mm and 70 mm and with the nominal density of 32 kg/m³ were placed in the gap. One layer of 95 mm mineral wool was placed in between the 2 layers of 70 mm mineral wool. See drawing No. TU_ST4_No4.

The plywood designated Radiata Pine TG2 15 mm with a width of 250 mm and a nominal density of approx. 500 kg/m³ were mounted on the construction wood to close the back side of the gap, plywood width 595 mm were used to close the front side of the gap. See drawing No. TU_ST4_No4.

Fixing of gaps:

On the backside of the gap, the construction wood C24 45 x 245 mm and 45 x 145 mm were fixed with each other together with screw designated NKT Spun+ 4.5 x 70 mm, the c/c distance of screws was 600 mm, and fixed to the prefabricated cassette with screws designated NKT Topkon TK 8.0 x 180 mm, the c/c distance between screws was 600 mm. The construction wood C24 45 x 100 mm and 45 x 195 mm were fixed with each other together with screw designated NKT Spun+ 5.0 x 120 mm, the c/c distance of screws was 600 mm, and fixed to the prefabricated cassette with screws designated NKT Spun+ 4.5 x 70 mm, the c/c distance between screws was 600 mm.

On the front side of the gap, the construction wood C24 45 x 145 mm was fixed to the prefabricated cassette with screws designated NKT Topkon TK 8.0 x 180 mm, the c/c distance between screws was 600 mm. The construction wood C24 45 x 70 mm was fixed to the prefabricated cassette with screws designated NKT Spun+ 4.5 x 70 mm, the c/c distance between screws was 600 mm.

The plywood was fixed to the construction wood C24 with screws designated NKT Spun+ 4.5 x 70 mm, the c/c distance between screws was 300 mm. See drawing No. TU_ST4_No4.

Insulation in first layer:

2 layers of insulation designated Hunton Nativo wood fiber board with a size of 1220 x 565 x 120 mm and a nominal density of 50 kg/m³ were placed in the prefabricated cassettes.

Second layer:

Two layers of Hunton wood fiber-based windbreaker boards 12 mm with a nominal density of 235 kg/m³, were mounted on the construction wood C24 of all three cassettes. See drawing No. TU_ST3_No3.

The fiber cement wind panel designated Cembrit Windstopper Basic with a thickness of 9 mm and a nominal density of 1450 kg/m³ were mounted on the plywood of the gap as the second layer. See drawing No. TU_ST3_No4.

Fixing of second layer: The wood fiber windbreaker boards were fixed with staples designated Tjep PZ-16 64 mm with a distance of 100 mm along the edges and 250 mm along the center of the boards.

The fiber cement wind panel were fixed with nails designated Tjep ZE 2.5 x 65 mm with a c/c distance of 150 mm.

Third layer:

A layer of Traspir alu 430 with a nominal thickness of 0.43 mm and a width of 1180mm was mounted on the top of the windbreaker with a horizontal overlap of 200 mm.

Fixing of third layer: The Traspir alu 430 membrane was fixed on the windbreaker with staples designated Tacwise 140 / 10 mm with a c/c distance of 200 mm.

The top and bottom edges of the membrane were taped on the fiber cement wind panel with tape designated Hunton Tescon Vana with a width of 60 mm. The overlaps of the membrane were taped with tape designated FRONT BAND UV 210.

See photo No. 8.

Flame deflector: The flame deflectors were made with 2 mm steel profile with a 4-degree slope top page. Fixed on the façade with 1 screw designated RedHorse CORONA™ RXB 4.8 X 60 EPDM-9.5B, the c/c distance between screws was 200 mm. Top and bottom profile fasten with 1 RF rivet designated Gesipa 4.0 x 8.0 mm, the c/c distance between rivets was 300 mm. Joint in fire deflectors between top and bottom profile is offset according to drawings. Longitudinal holes were minimum 20 mm long and the screws were placed in the middle of elongated hole during assembly so that expansion could take place. The flame deflectors protruded 324 mm out from the surface of the cladding and 280 mm out from the edge of the façade. The top Flame deflector protruded approx. 1000 mm out from the edge of the façade on both sides. They air gap inside the Flame deflectors was filled with insulation at the ends to prevent a horizontal air flow.

All details about the flame deflectors are shown on the following drawings: GKB-116644, GKB-116645, GKB-116646-indv, GKB-116647-indv and drawing No. TU_ST3_No8.

Formwork: The impregnated wood formworks with a dimension of 25 x 50 mm with a nominal density of 450 kg/m³ were mounted horizontally of the main façade. The distance between the formwork as shown on drawing No. TU_ST3_No6.

Fixing of formwork: The formworks were fixed with 1 nail designated Tjep GR 3.1 x 90 ring the c/c distance between nails was approx. 300 mm. The min. distance between the formwork ends and the nail was 50 mm.

Cladding: Wooden boards designated Frøslev profile 2685 with a dimension of 21 x 120 mm and nominal density of 400 kg/m³ with groove and tongue were mounted horizontally on the top of the formworks as the cladding.

Fixing of cladding: The cladding was fixed on the formwork horizontally with 1 nail designated Tjep ZE 2.5 x 50 mm ring. See drawing No. TU_ST3_No7.

Finishing layer: The Frøslev 25 x 50 civil profiles 4262H with a size of 21 x 45 mm and a nominal density of approx. 450 kg/m³ were fixed vertically on the cladding. The c/c distance of the profiles as shown on drawing No. TU_ST3_No7.

Fixing of finishing layer: The Frøslev 25 x 50 civil profiles were fixed with 1 nail designated Tjep ZE 2.5 x 50 mm ring. The c/c distance of the nails was approx. 120 mm.

Window and fire chamber details: **Top of window and fire chamber:** The 0.6 mm Alu-Zink profiles were mounted on the top of the window and fire chamber with 1 Tjep ZE 2.5 x 50 mm Ring nail. The c/c distance of nails was 300 mm. They were protruding 70 mm from the cladding. The profile has a 6-degree slope top page.

The profiles on top of the window are shown on drawing No. TU_ST4_No5.

Bottom of window:

The 0.6 mm Alu-Zink profiles were mounted on the bottom of the window with 1 Tjep ZE 2.5 x 50 mm Ring nail. The c/c distance of nails was 300 mm. They were protruding 70 mm from the cladding. The profile has a 6-degree slope top page.

The profiles on bottom of the window are shown on drawing No. TU_ST4_No3.

Window and Fire chamber sides:

The 0.6 mm Alu-Zink profiles were mounted on window and fire chamber sides with 1 Tjep ZE 2.5 x 50 mm Ring nail. The c/c distance of nails was 300 mm. They were protruding 70 mm from the cladding.

The profiles on top of the side of window are shown on drawing No. TU_ST4_No2.

Insulation and sealant: Between the prefabricated cassette and the aerated concrete of the façade the mineral wool was used to close the gap.

The side of the main façade was covered by mineral wool insulation.

Between the prefabricated cassette and the aerated concrete around the fire chamber and the ceramic wool was used to close the gap and on top of that a fire sealant was used to close of the airgap.

*The density of the cladding measured by DBI is more than 10% higher than the nominal density.

Test conditions

Conditioning

The materials for the test specimen were delivered on the 23-10-2023 to the DBI laboratory and stored under room temperature. On the day of the fire testing the condition of the test specimen was similar with respect to its moisture content as the test specimen would be in normal service.

The installation of the test specimen on the test rig was completed on the 26-10-2023.

Mounting

The test specimen was mounted on the test rig that had a size of 7990 mm in height and with main surface of 3620 mm and wing 1900 mm wide. The surface of the test rig was built with 150 mm aerated concrete blocks, with a nominal density of 575 kg/m³.

The design and location of the combustion chamber opening in the main face was in accordance with the design details specified in the standard ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE Draft revision 6, Draft Date: 2022 – 11 – 18.

Each of the two vertical sides was closed off with stone wool before the fire test.

Fire test

The fire test was conducted in the following conditions:

- Ambient temperature: approx. 7 °C at the start of the test (see Enclosures 3.0 and 3.1)
- Ambient air velocity: Not measured (test undertaken indoor where ambient air speed and/or wind did not affect the test)
- Mechanical exhaust: 80.000 m³/h (at ambient temperature) even distributed in the ceiling of the test hall with a combined exhaust duct to the air filter cleaning system.

Observations were made during the test on the general behaviour of the test specimen.

Temperature observations were taken continually during the entire testing time.

The temperatures were measured on the external and internal layers of the test specimen as indicated on DBI drawing enclosure no. 1.0 - 1.1. All thermocouples that were used according to the standard ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE are named I.1.1-I.9, I.2.1-I.2.8 and I.3.1-I.3.8. All other thermocouples are for informative uses.

The temperature was determined by means of type-K sheathed thermocouples specified in, ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE.

The thermocouples named I.1.1-I.9, I.2.1-I.2.8 and I.3.1- I.3.8 were constructed of junctions of nickel chromium/nickel aluminium (type K) wire as defined in EN 60584-1 contained within mineral insulation in a heat resisting alloy sheath of nominal diameter 2.0 mm. Designated as a sheathed thermocouple.

The furnace plate thermocouples were constructed according to EN 1363-1, and all other thermocouples were made from type-k thermocouples wire with 0.5mm in diameter twisted together in the end.

The wood crib was constructed flowing the principles in ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE. The dimensions of the spruce sticks were approx. 45x45 mm and the external dimension of the 24-layer wood crib was 1.5m x 1m x 1.08m (width x depth x height). The wood crib was stored at approx. 20°C in dry conditions and was at the time of the fire test in equilibrium with the surroundings. The spruce sticks were nailed together to construct the crib and was installed on a closed bottom surface made of a 20 mm thick calcium silicate board with dimensions of 1300 mm x 1900 mm. The crib was placed 100 mm from the back wall and centred from the sidewalls of the combustion chamber. The average density of the wood was approx. 500 kg/m³.

In front of the combustion chamber, a platform was placed which had a size of 1850 x 3200 mm. It was placed with the upper edge 100 mm below the floor of the combustion chamber. This was done to simulate a comparable air flow and buoyancy that will occur if the weight for fallings parts was used. which should have been placed in front of the facade according to ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE section 4.7.4.

The test was terminated after 60 minutes.

Test results

Duration of the test was 60 minutes.

Measurements

The enclosed graphs and tables show:

Enclosures 2.0 and 2.1 The temperature in the fire chamber during the test

Enclosures 3.0 and 3.1 Ambient temperature
The ambient temperature in the laboratory during the test

The photographs on the attached photo sheets show the test specimen during the mounting, testing and after the test. See the description at each photo.

Conclusion

Fire testing according to daft version of: ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE, the construction described in this test report showed that failure according to the performance criteria stated in the test method occurred at the following time:

| Performance | Criterion | Test result |
|--------------------------------|---------------------------|-------------|
| Fire spread | | |
| | Vertical fire spread | 60 minutes |
| | Horizontal fire spread | 4 minutes |
| | Burning parts | 25 minutes |
| Falling parts – Level 0 | | |
| | Falling parts – (Level 0) | 20 minutes |
| Falling parts – Level 1 | | |
| | Falling parts – (Level 1) | No failure |
| Falling parts – Level 2 | | |
| | Falling parts – (Level 2) | No failure |

The test was terminated after 60 minutes.

Remarks

The test was an Ad-Hoc test, there is no field of application.

This report details the method of construction, the test conditions and the results obtained when the specific element of construction described herein was tested following the procedure outlined in ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE.

Because of the nature of fire resistance testing and the consequent difficulty in quantifying the uncertainty of measurement of fire resistance, it is not possible to provide a stated degree of accuracy of the result.

This report has only been printed in a pdf-version. DBI has not issued a hard copy version.
All values mentioned in this report are nominal values, production tolerances are not considered.

The test was not performed accredited.

Membran
Traspir ALU FIRE A2 430
Monteres med
hæfteklammer,
samles med overlap på 200
mm ved vandret montage.
samlinger tapes med
FRONT BAND UV 210
Traspir Traspir ALU FIRE A2
430
Første bane udrulles vandret
på konstruktionen.
Der monteres nedefra og
opad.

Vindspærre
Hunton Vindtæt
2x 12 mm
Samlet i forbandt
jf. tegninger
Fæstnes med 840265 PZ-16
klammer 64 mm,
elgalvaniseret 12+

Afstandsliste
25X50
Monteres lodret pr
600 mm
Fastgøres med
Tjep ringsøm
varmgalvaniseret
3,1X90

Isolering
Hunton Nativo
2 x 120
Klasse E
Monteres i forbandt

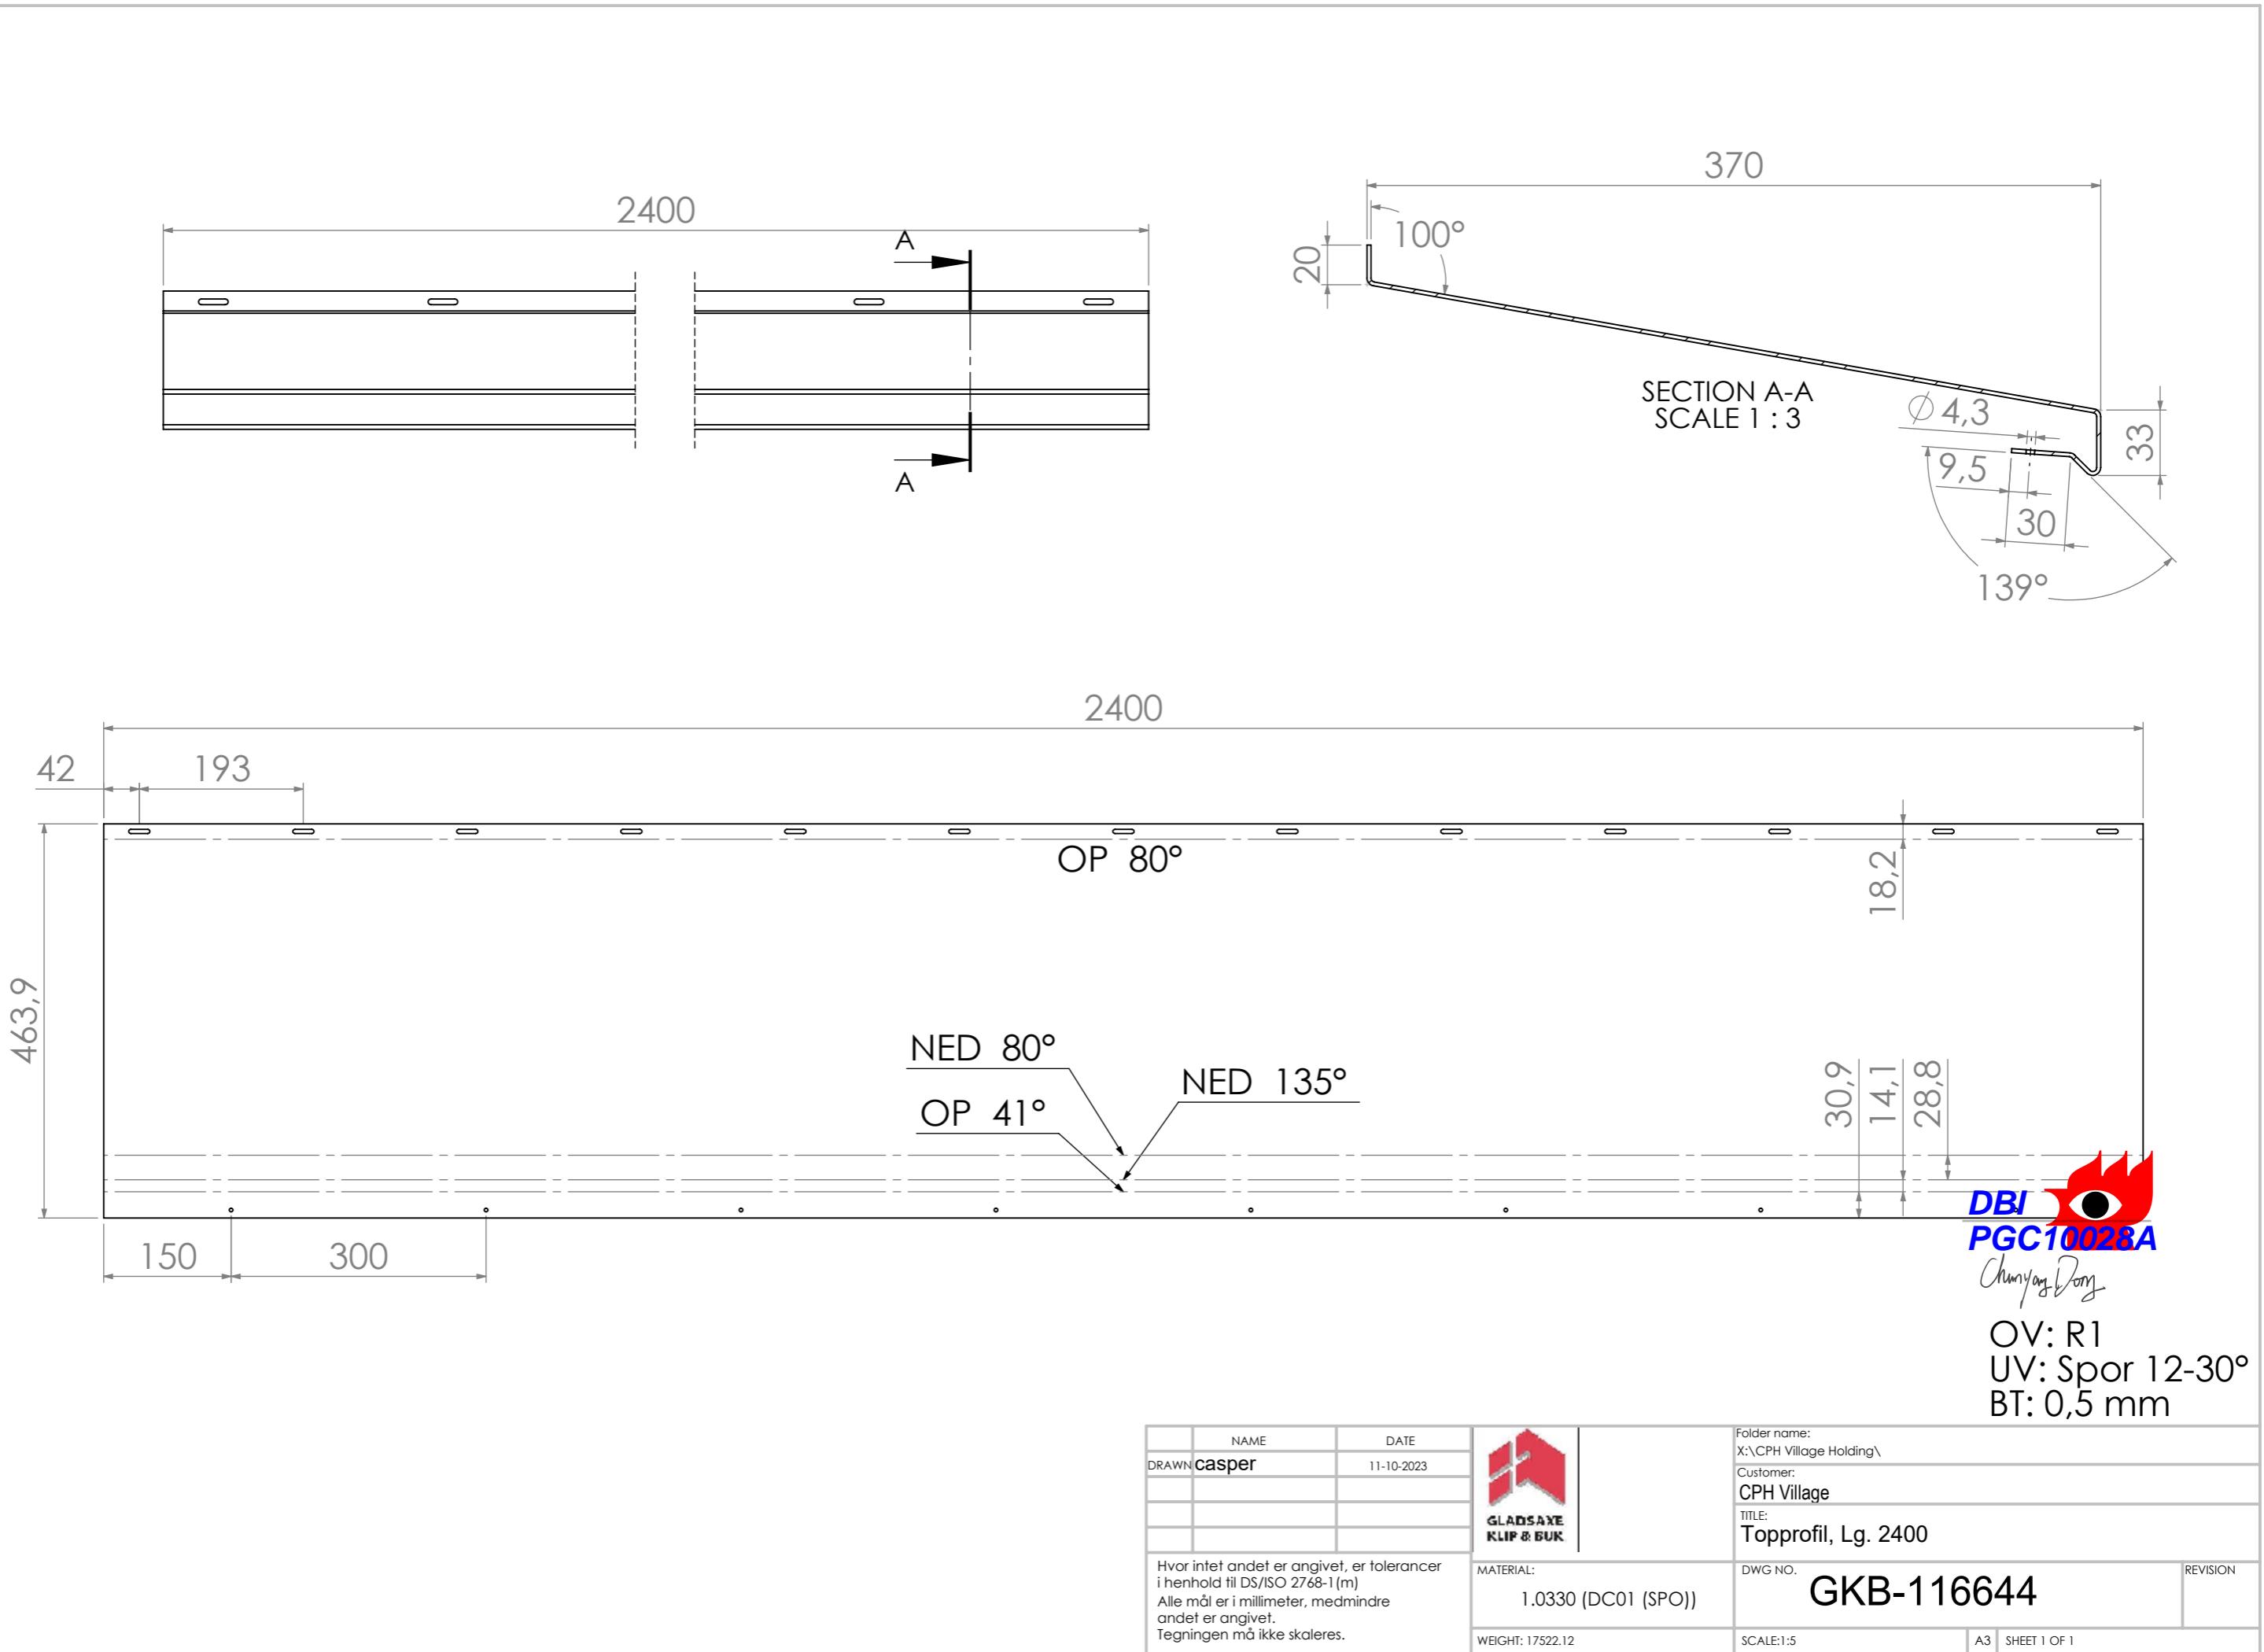

Inddækning over vindue
