Date of test

The test was conducted on 06-03-2024.

Purpose of test

Examination of the fire performance of a façade using the large fire exposure.

The test specimen has been subjected to a fire test in accordance with the following draft standards:

ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE

Draft revision 6

Draft Date: 2022 – 11 – 18

The test was not performed accredited.

Test specimen

The trade name and sponsors identification mark are stated below:

Trade name: None
Identification mark: None

The components for the test specimen were delivered and mounted by the sponsor.

Drawings and description

Details of the construction are shown in the enclosed documentation as stated below:

The documentation is supplied by the sponsor, and it is stamped by DBI - Danish Institute of Fire and Security Technology

Description

The test specimen consisted of the components described in the following. DBI inspected the components during mounting, the test and after the test.

The sponsor carried out the selection of the products for the test specimen as well as the mounting.

Test specimen			
External measures:	Height main: 9235 mm	Width main: 3180 mm	Thickness: 276 mm With flame deflector: 531.5 mm

The test specimen was a ventilated façade. On the main façade, the prefabricated walls were mounted on aerated concrete frame as the first layer. The vertical steel projection, horizontal flame deflector and pressure impregnated formwork were mounted on the prefabricated walls. The wooden cladding was mounted on the formwork as the surface of the facade. The façade wing consisted of 100 mm thick aerated concrete.

The build-up of the façade system is shown on the attached drawings, which is supplied by the sponsor. The construction of the wall is described from the first layer on the aerated concrete frame.

First Layer: The first layer consisted of prefabricated walls. The frame and the studs of the walls were built from untreated construction wood with a strength class of C24. The dimensions of the construction

wood were 45 x 220 mm with a nominal density of 480 kg/m³. The construction wood was fixed to each other in all ends with 2 nails designated Paslode 2.5 x 50 hot-dip galvanized ring shank. The c/c distance between each vertical stud is shown on drawing ESR_K01_H4_EXX_N3011.

One layer of 0.2 mm PE vaper and one layer of Isover Insulsafe Blanket was mounted on the back side of the prefabricated walls. Both layers were mounted on the construction wood C24 with TJEP BE-80 8 mm staples with a c/c distance of approx. 20 mm. The tape designated Storm yellow liner with a width of 50 mm, was used on the overlap of the PE vaper at the 4 edges of the prefabricated wall to stick the PE vaper on to the construction wood.

Plasterboard in the first layer

One layer of 2400 x 1200 x 9.5 mm Siniat weather defence plasterboard, with a nominal density of 860 kg/m³, was mounted on the front side of prefabricated wall. The weather defence board was mounted on the C24 construction wood with the screws designated Spit P-screw HWS 4.2 x 42 with a c/c distance of 180 mm. Two pieces of tape, designated Paroc XST 042 had a width of 50 mm. An overlap was applied on the joints of 2 plasterboards, which resulted in a total width of 80 mm on the joints. The vertical tapes were covered on the top of the horizontal tapes at the cross board joint sections.

Insulation in the first layer

Insulation designated Isover Insulsafe loose wool L 34, with a nominal density of 30 kg/m³, was blown in the prefabricated walls frame between Isover Insulsafe Blanket and the weather defence boards.

There were 4 walls in total, with a total size of 3180 x 229.5 mm (width x thickness). The height of each wall was 2680 mm, 3190 mm, 3190 mm, and 145 mm from the bottom to the top. They were mounted with a 10 mm horizontal gap in between. The 4 walls protruded approximately 1245 mm from the top edge of aerated concrete façade rig. The Isover Tät with the width of 95 mm and thickness of 20 mm was placed in the entire horizontal gap between 2 walls. A Z-profile with a size of 20 x 10 x 20 mm, had a thickness on 0.55 mm, and was mounted at the lower edge of 2 x 3190 mm walls. One side of the Z-profile was fixed between the construction wood and weather defence boards, the other side covered the upper edge of the below wall.

See drawing ESR_K01_H4_EXX_N3012.

Fixing of first layer:

The prefabricated walls were fixed to the aerated concrete frame with steel angles designated Paslode 90 x 90 x 65 mm, with screws designated Paslode 5.0 x 40 mm. The 4 screws were mounted in each angle connected to the wood. The Paslode angles was fixed to the aerated concrete with one screw designated Spit ACS CSK ø 8 x 90 mm. The bottom wall was put on 2 ACW 155 Simpson strong-tie console brackets, which were fixed to the aerated concrete frame with 4 screws designated Spit ACS CSK ø 10x 160 mm. One screw designated Paslode 5.0 x 40 mm was used to connect the wall and each console bracket.

Horizontal flame deflector:

The 3 horizontal flame deflectors were mounted on the prefabricated walls with a c/c distance of 3190 mm. The flame deflectors were protruding approx. 500 mm from the prefabricated wall edge. See drawing ESR_K01_H4_EXX_N3013.

The detailed information of how to connect the different part of flame deflector is shown on drawing no. ESR_K01_H5_EXX_N3010. The detailed information of different components is shown in drawing no. GKB-117518-1 sheet 1 to 6.

The screw designated RedHorse CORONA™ RXB 4.8 X 60 were used to fix the flame deflector to the prefabricated wall with a c/c distance of approx. 200 mm.

The screw designated DS stålprofil LP 4.8 x 23 Boreskrue were used to fix the steel components of the flame deflector with a c/c distance of approx. 200 mm. See drawing ESR_K01_H5_EXX_N3010.

Vertical steel column: The 2 Vertical steel projections were mounted on the prefabricated walls and connected with the horizontal flame deflectors.

Two 1 mm C-profiles were mounted face to each other on a vertical direction with a distance of 275 mm, they were fixed to the wall with screws designated Red Horse corona RXB 4.8 x 60 with a c/c distance of 600 mm. Detailed information of the vertical column is shown on drawing No. GKB-117517-3.

The 1 mm DS steel Lokumsbræts were mounted horizontally on C-profiles with 2 screws designated DS stålprofil LP 4.8 x 23 Boreskrue on each side. The width of the steel profile called Lokumsbræt was 272 mm, the height was 45 mm with a hole of Ø222 in the middle. The c/c distance of two pieces of Lokumsbræts was 900 mm. Detailed information of the profile called Lokumsbræt is shown on drawing No. GKB-117518-2.

The 1 mm cassette profiles were mounted on the C-profiles with one screw designated DS stålprofil LP 4.8 x 23 Boreskrue with a c/c distance of 300 mm on each side. Detailed information of the cassette is shown on drawing No. GKB-117517-9.

See drawing ESR_K01_H5_EXX_N3012.

Formwork: The pressure impregnated formwork designated Frøslev 25 x 50 mm nominal density of 450 Kg/m³ was mounted on the prefabricated wall as the substrate for the cladding.

908 mm length formworks were mounted horizontally at the right side of first vertical steel projection with a c/c distance of 450 mm. 485 mm length formworks were mounted under each horizontal flame deflectors with a c/c distance of approx. 490 mm. Two adjustment pieces designated Harpun Justerbrik Reglar 45 size 80 x 45 x 3 mm, were put between the horizontal formwork and the prefabricated wall.

See drawing ESR_K01_H4_EXX_N3014.

Fixing of formwork: Nails designated TJEP HDG GR 3.1 x 90 mm ring, were used to fix the formwork on the prefabricated wall. On horizontal formworks two nails were used where the nails were mounted approx. 80 mm from the end. On the vertical formworks, the c/c distance between the nails was 600 mm.

Finishing layer (cladding): The wood cladding designated Moelven Finnforest ThermoWood Profile 3301, size 21 x 118 mm with a groove and tongue principle and a nominal density of 435 Kg/m³ were mounted on top of the formwork. Vertical claddings were mounted on the horizontal formworks, horizontal claddings were mounted on the vertical formworks.

The Nordland snow catch pipes Ø32 pipes were put between the wall and the claddings on the top and bottom of the horizontal flame deflector.

See drawing ESR_K01_H5_EXX_N3010.

Fixing of cladding: The cladding was fixed with one TJEP stainless ZE 2.5 x 50 mm ring, on the formwork with a c/c distance of 450 mm.

Window and Fire chamber details: The 1 mm flashing were mounted around the windows and fire chamber as the top bottom and side profile. The flashing was mounted between the construction wood and the weather defence of the prefabricated wall, with one nail designated Paslode 2.5 x 50 mm which had a c/c distance

of 180 mm. The profiles were protruded 10 mm from the cladding and 55 mm from the back of the 45 x 95 mm construction wood.

Detailed information of the flashing shows in drawing No. GKB-117517-8.

Gap insulation: The 10 mm gap between the main façade and wing, and the gap between the aerated concrete and prefabricated wall, were filled with Rockwool insulation.

Sealant and ceramic wool: Between the prefabricated wall and the aerated concrete in the fire chamber, ceramic wool was used to close the gap. A fire sealant was used to close off the airgap.

Test conditions

Conditioning

The materials for the test specimen were delivered on the 26-02-2024 to the DBI laboratory and stored under room temperature. On the day of the fire testing the condition of the test specimen was similar with respect to its moisture content as the test specimen would be in normal service.

The installation of the test specimen on the test rig was completed on the 01-03-2024.

Mounting

The test specimen was mounted on the test rig that had a size of 7990 mm in height and with main surface of 3620 mm and wing 1900 mm wide.

The surface of the test rig was built with 150 mm aerated concrete blocks, with a nominal density of 575 kg/m³.

The design and location of the combustion chamber opening in the main face was in accordance with the design details specified in the standard ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE Draft revision 6, Draft Date: 2022 – 11 – 18.

Each of the two vertical sides was closed off with stone wool before the fire test.

Fire test

The fire test was conducted in the following conditions:

- Ambient temperature: approx. 11 °C at the start of the test (see Enclosures 3.0 and 3.1)
- Ambient air velocity: Not measured (test undertaken indoor where ambient air speed and/or wind did not affect the test)
- Mechanical exhaust: 80.000 m³/h (at ambient temperature) even distributed in the ceiling of the test hall with a combined exhaust duct to the air filter cleaning system.

Observations were made during the test on the general behaviour of the test specimen.

Temperature observations were taken continually during the entire testing time.

The temperatures were measured on the external and internal layers of the test specimen as indicated on DBI drawing enclosure no. 1.0 - 1.3. All thermocouples that were used according to the standard ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE are named I.1.1-I.9, I.2.1-I.2.4, I.3.1-I.3.4. All other thermocouples are for informative uses.

The temperature was determined by means of type-K sheathed thermocouples specified in, ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE.

The thermocouples named I.1.1-I.9, I.2.1-I.2.4, I.3.1-I.3.4. were constructed of junctions of nickel chromium/nickel aluminium (type K) wire as defined in EN 60584-1 contained within mineral insulation in a heat resisting alloy sheath of nominal diameter 2.0 mm. Designated as a sheathed thermocouple.

The furnace plate thermocouples were constructed according to EN 1363-1, and all other thermocouples was made from type-k thermocouples wire with 0.5 mm in diameter twisted together in the end.

The wood crib was constructed flowing the principles in ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE. The dimensions of the spruce sticks were approx. 45x45 mm and the external dimension of the 24-layer wood crib was 1.5m x 1m x 1.08m (width x depth x height). The wood crib was stored at approx. 20°C in dry conditions and was at the time of the fire test in equilibrium with the surroundings. The spruce sticks were nailed together to construct the crib and was installed on a closed bottom surface made of a 20 mm thick calcium silicate board with dimensions of 1300 mm x 1900 mm. The crib was placed 100 mm from the back wall and centred from the sidewalls of the combustion chamber. The average density of the wood was approx. 500 kg/m³.

In front of the combustion chamber, a platform was placed which had a size of 1850 x 3200 mm. It was placed with the upper edge 100 mm below the floor of the combustion chamber. This was done to simulate a comparable air flow and buoyancy that will occur if the weight for fallings parts was used. which should have been placed in front of the facade according to ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE section 4.7.4.

Test results

Duration of the test was 22 minutes.

Measurements

The enclosed graphs and tables show:

Enclosures 2.0 and 2.1 The temperature in the fire chamber during the test

Enclosures 3.0 and 3.1 Ambient temperature
The ambient temperature in the laboratory during the test

Enclosures 4.0 and 4.1 Location 1 - Flux

Enclosures 5.0 and 5.1	Temperature measured in the ventilated cavity
Enclosures 6.0 and 6.1	Temperature measured in the ventilated cavity
Enclosures 8.0 and 8.1	Location 1,2 - Plate TC 1.4m and 2.5m height Plate TC.1 Location 1 Plate TC.2 Location 2

Enclosures 25.0 and 25.1	Vertical measurements on the wing
Enclosures 26.0 and 26.1	Horizontal measurements
Enclosures 27.0 and 27.1	Horizontal measurements
Enclosures 28.0 and 28.1	Plate thermocouple on facade

Visual observations:

Time / Minutes	Visual observations:
0	Test commences
1	The flame reaches above first flame deflector (In the middle of the first window)
1	Cladding between first flame deflector and fire chamber started burning
3	Flames had reached the upper edge of the first window
4	Flames had reached below the second flame deflector
4	Cladding below the second flame deflector started burning
5	Smoke began to develop from the gap between the steel column and the façade wing near second flame deflector
6	A 10 cm x 10 cm piece dropped on the floor and continued to burn (more than 2 minutes)
7	A lot of sparks were flying up from the test specimen
7	Second flame deflector started burning
8	Flames had reached above second flame deflector
11	Flames had reached to the bottom of second flame deflector
13	Some pieces 10 x 10 cm began to drop on the floor
15	Entire cladding between first and second flame deflector was burning
17	More pieces 10 x 10 cm continued dropping on the floor
18	More pieces 20 x 20 cm continued dropping on the floor
18	The cladding on the top of the second window decolorized
19	A few more pieces dropped on the floor
20	More pieces dropped on the floor
20	Charring appeared under the third flame deflector
21	Flames had reached above the third flame deflector
21	Cladding between third flame deflector and second window started burning
22	Test stop

The photographs on the attached photo sheets show the test specimen during the mounting, testing and after the test. See the description in each photo.

Conclusion

Fire testing according to daft version of: ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE, the construction described in this test report showed that failure according to the performance criteria stated in the test method occurred at the following time:

Performance	Criterion	Test result
Fire spread	Vertical fire spread	No failure
	Horizontal fire spread	10 minutes
	Burning parts	6 minutes
Falling parts – Level 0	Falling parts – (Level 0)	6 minutes
Falling parts – Level 1	Falling parts – (Level 1)	No measurement
Falling parts – Level 2	Falling parts – (Level 2)	No measurement

The test was terminated after 22 minutes due to the fire had spread to the second window.

Remarks

The test was an Ad-Hoc test, there is no field of application.

This report details the method of construction, the test conditions and the results obtained when the specific element of construction described herein was tested following the procedure outlined in ASSESSMENT OF FIRE PERFORMANCE OF FACADES USING LARGE FIRE EXPOSURE.

Because of the nature of fire resistance testing and the consequent difficulty in quantifying the uncertainty of measurement of fire resistance, it is not possible to provide a stated degree of accuracy of the result.

This report has only been printed in a pdf-version. DBI has not issued a hard copy version.

All values mentioned in this report are nominal values, production tolerances are not considered.

The test was not performed accredited.

CAMERA LOCATION

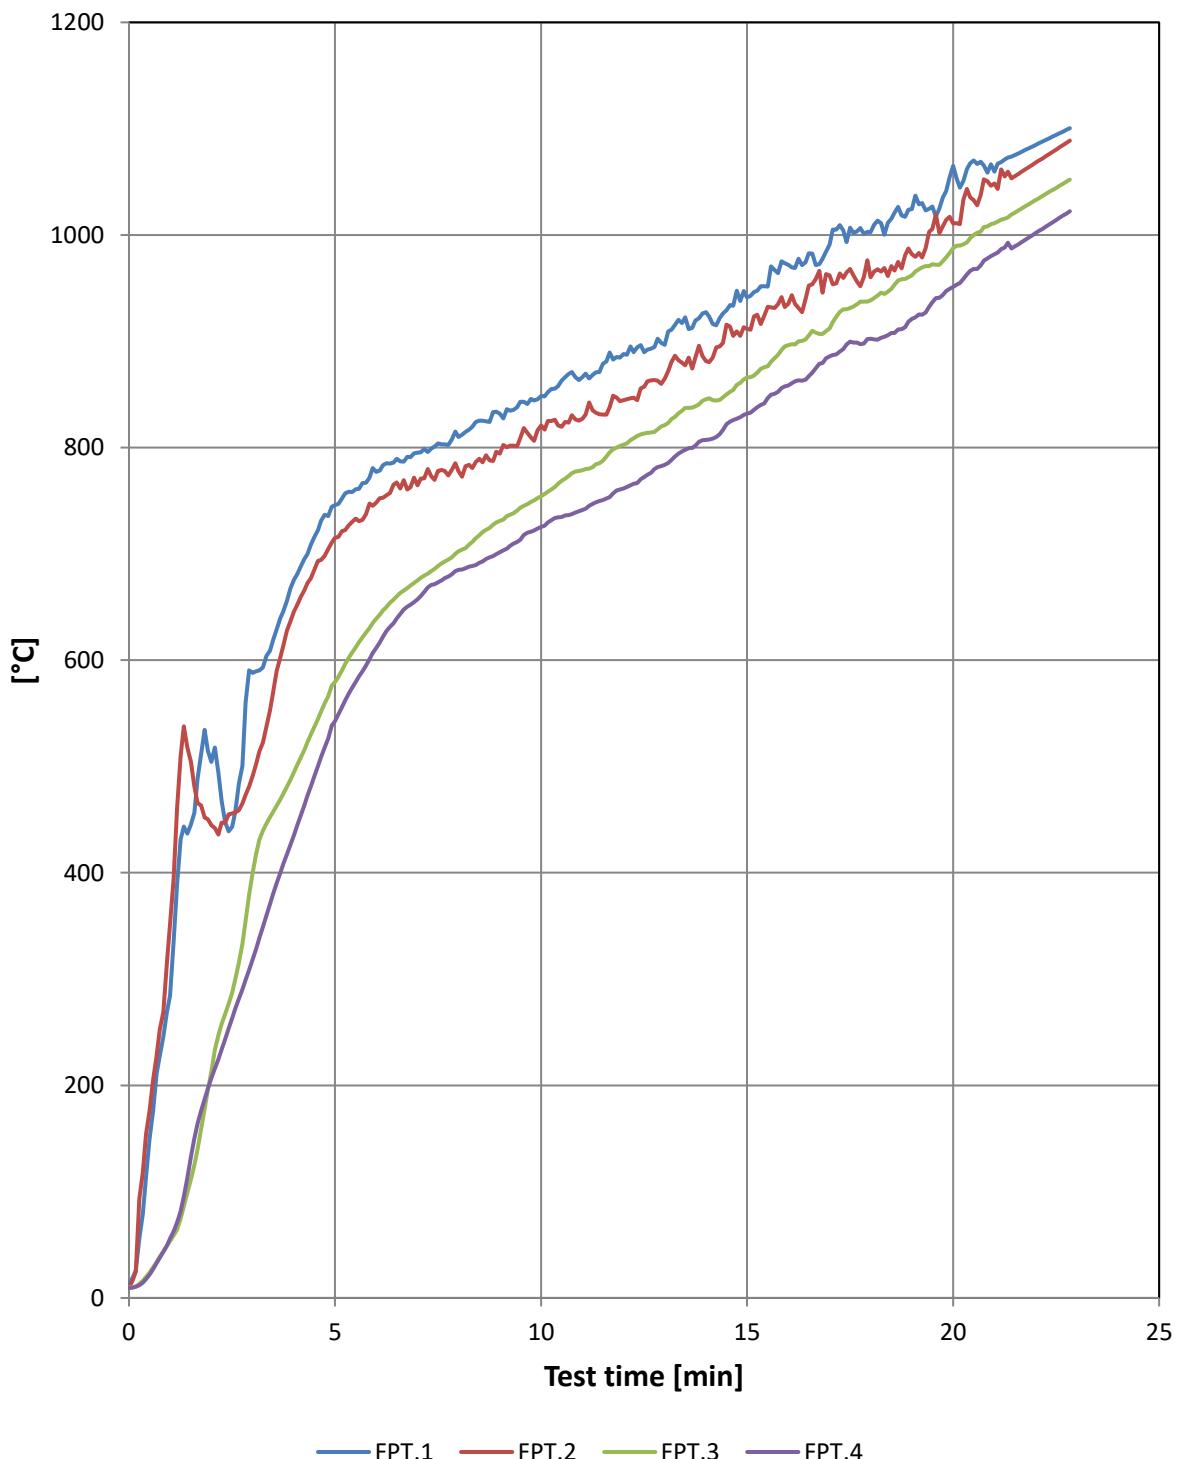

NOTE:

- Location 1: 3 m away to the center of the combustion chamber (both horizontally and vertically), a plate thermometer, a thermocouple and a water cooled heat flux censor.
- Location 2: 5 m away from the facade wall, 2.5 m above the ground and 4.5 m above the ground, a plate thermometer and a thermocouple.
- Location 3 : 1 camera from the side view, 4 meters hight, mounted on the SP-FIRE rig, observerving the test from the side.
- Location 4: 1 camera from front view, 4 meters hight, mounted on the gas-beton rig, at the opposite end of the facadehall in the corner.
- Location 5: 6 blue LED lights, light should focus on the second section of the facade.
- Location 6: two plate thermometers + two wire thermocouples inside the combustion chamber.
- Location 7 and 8: bi-direction velocity tube together with a wire temperature thermocouple to measure the measuring the flow speed towards the wood crib

Note: height indicator every 500 mm at two edges of the facade.

Taasinge z-profil i vandrette samlinger i mellem elementer

Montage af vindgips iht. Siniat_Weather_defence_-_Godkendelse.pdf SKAL UDLEVERES TIL DE UDFØRENDE

Nedenstående er et udklip fra vejledning

Skruer til fastgørelse af **gips** på træ.
Type: Spit hårdgipsskruer, ELFZ, 4,2 x 42mm.
Skrues med kantafstand 10-15mm max. 300mm c/c afstand maks. c/c stolpeafstand 600mm

TAPE TIL VINDGIPS
Paroc XST 042 Cortex B-Tape, 60mm, sort

Installation
Weather Defence is installed on studs with maximum centre distance c/c 600 mm. The boards are installed on a frame with screws of type Spit hårdgipsskrue, ELFZ, 4,2 x 42mm at intervals of maximum 300 mm in all board joints and in the middle section of the boards. The screw heads must be flush with the surface of the board. The distance from the screws to the edge of the boards must be at least 10 mm and at least 15 mm from edges where the gypsum core is exposed. For contact with base, windows, doors, roof, and bushings, see relevant

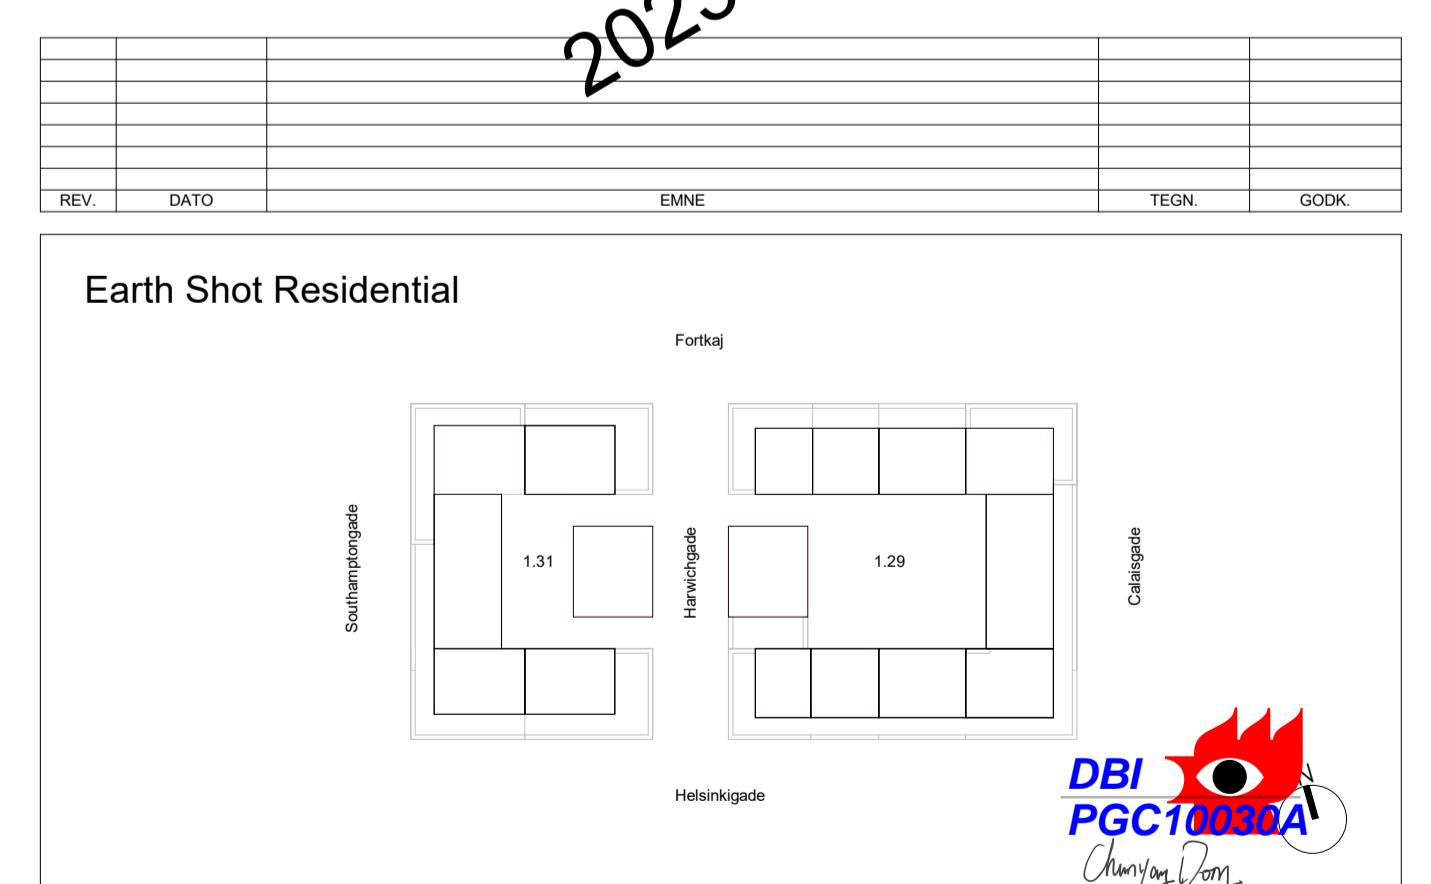

In general, it is recommended to cover the wind barrier with an external cladding as soon as possible. However, it is considered that the wind barrier system can remain uncovered, as indicated in clause 4 "Properties", provided that the building is not subjected to large amounts of driving rain. It is also a prerequisite that all joints are protected with tape and that all board edges (for instance along the bottom, sides and top of the wall, and around wall penetrations) are protected against rain.

When the boards are used for wind bracing, as specified in section 4, all board edges shall be supported by studs of at least 45 mm width.

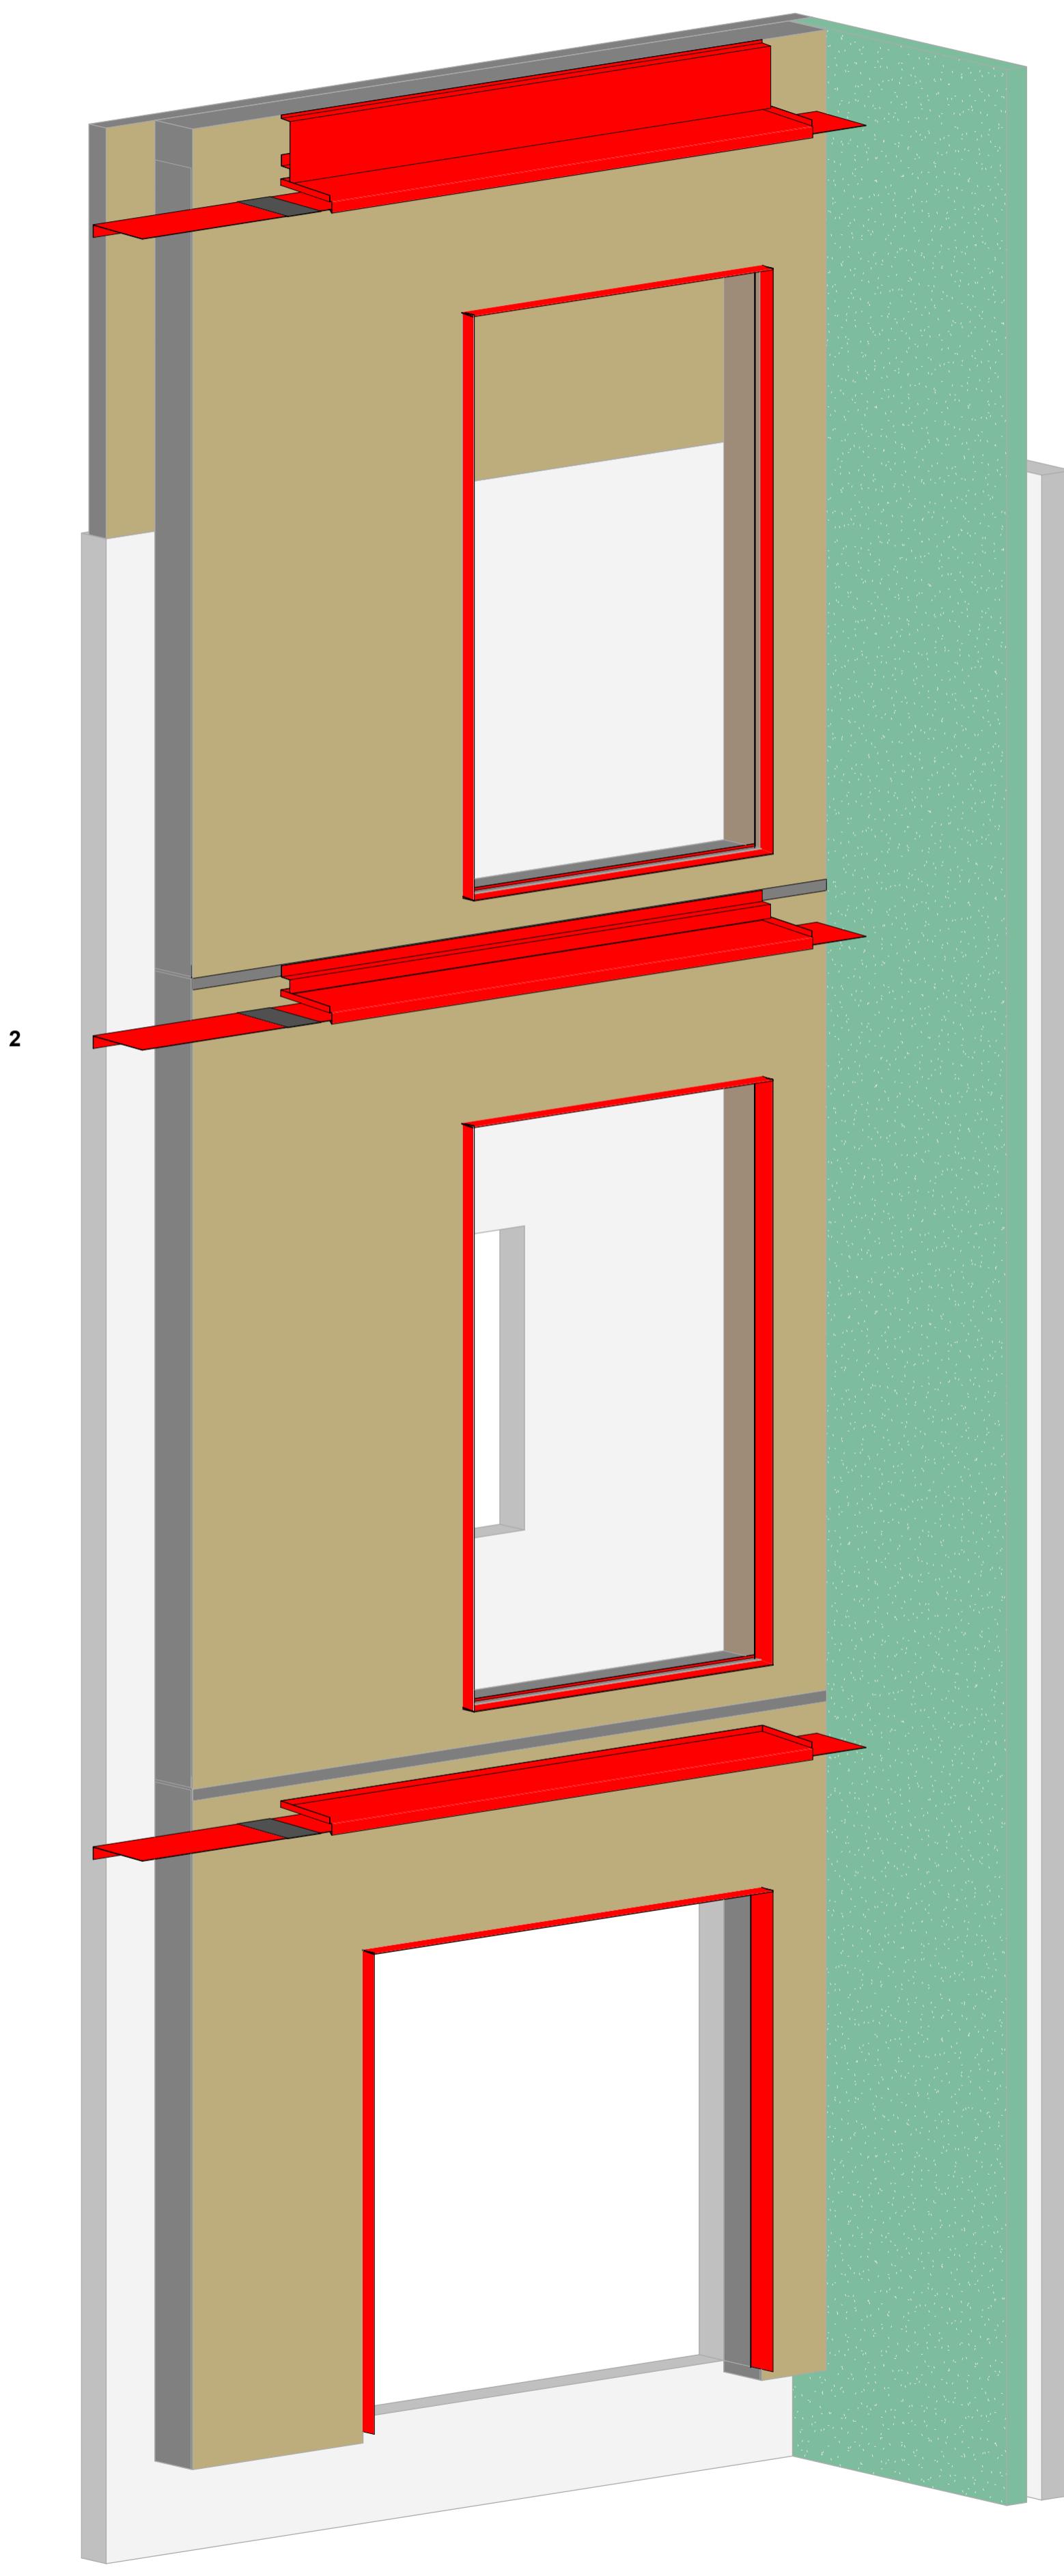

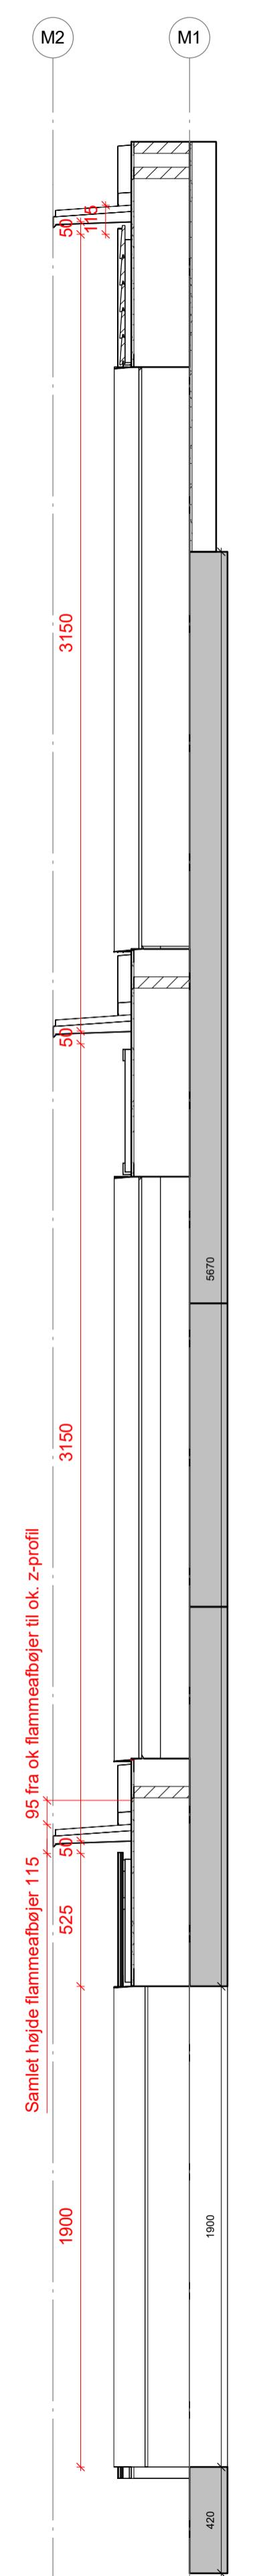

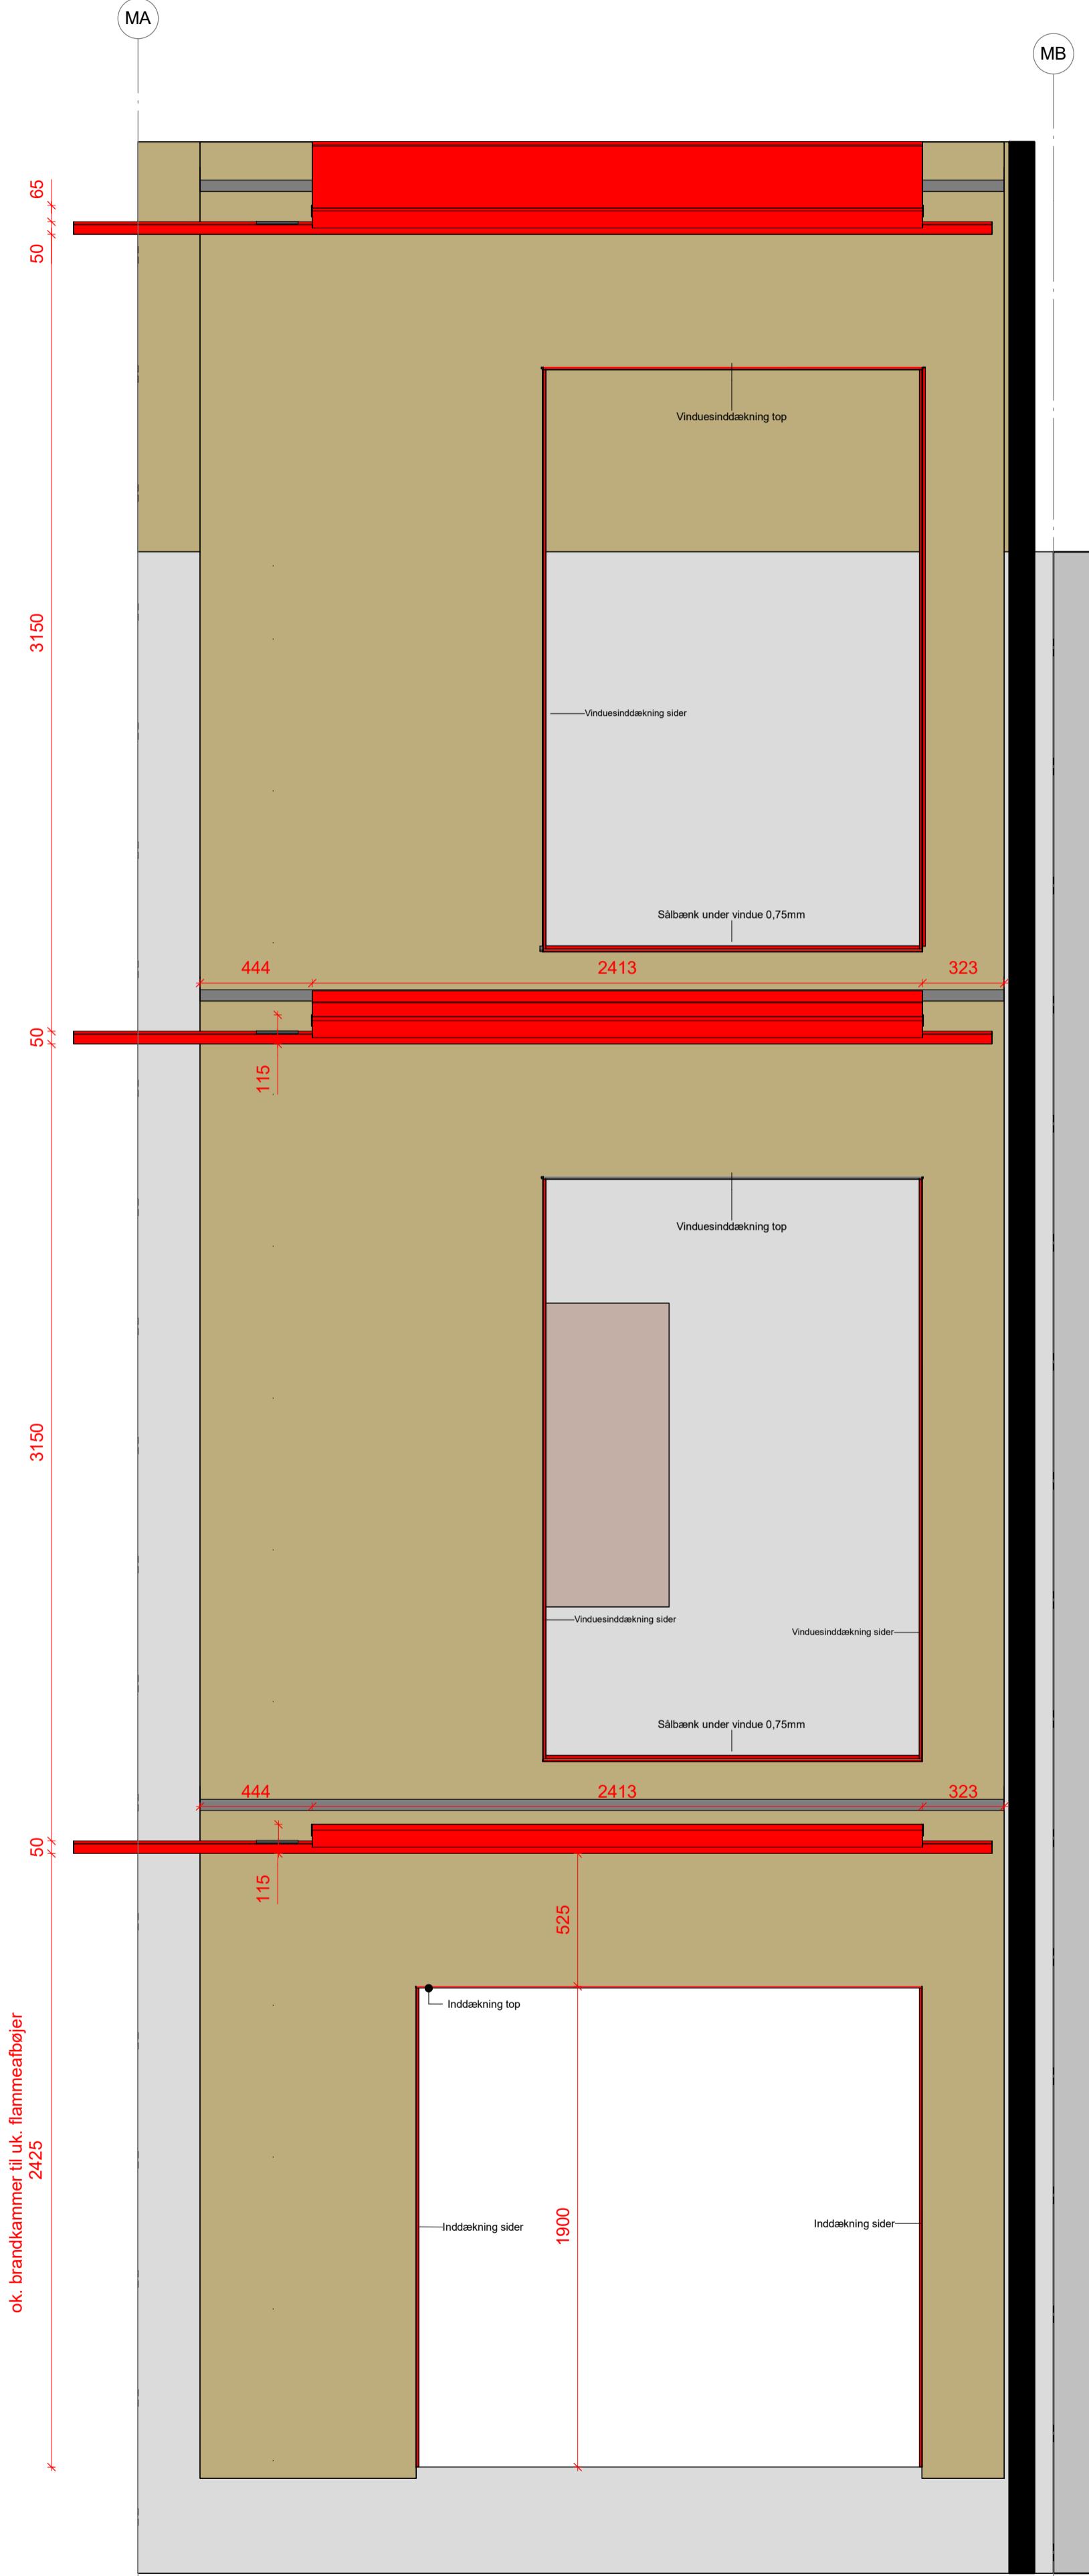

Screws
Spit hårdgipsskrue, ELFZ, 4,2 x 42mm screws with length of at least 42 mm must be used when fixing in wood.

Sealing of joints
SIGA Wigluv sealing tape, with a width of at least 50 mm, must be used. Horizontal joints must be sealed with two tape strips where the upper tape strip overlaps the lower tape strip with 25 mm before the vertical joints are sealed. The surface of the boards must be dust-free and dry before the tape is applied. The manufacturer's instructions must be followed.

Transport and storage
The boards shall be transported and stored in accordance with the manufacturer's recommendations.

Type: Fastgørelse med RF-Skrue m. børespids. RedHorse CORONA™ RXB 4.8 X 60 #1 TX20EPDM-9.5B1 stk. / 450mm c/c

Skruer til fastgrelse af lysninger på bæjler og flanger i lodrette facadesøjler:
Type: DS Montageskrue til stålunderlag 4.8 x 22 mm Torx Galvaniseret/#2+ DB Nummer 1292807 10 stk. / lyskeplade, skrues 3 stk. på hver side af samlinger 15mm fra kanten. og 4 stk. for fastholdelse.

Skruer til fastgrelse af **gips** på træ:
Type: DS Montageskrue til stålunderlag 4.8 x 22 mm Torx Galvaniseret/#2+ DB Nummer 1877444

Skruer til fastgrelse af **Afstandslistefastgørelse af træ** på vindgips og underlag af reglar:
Type: TJEP GR 3,1x90 mm, varmgalv. pr 600mm c/c min 50mm fra endetræ

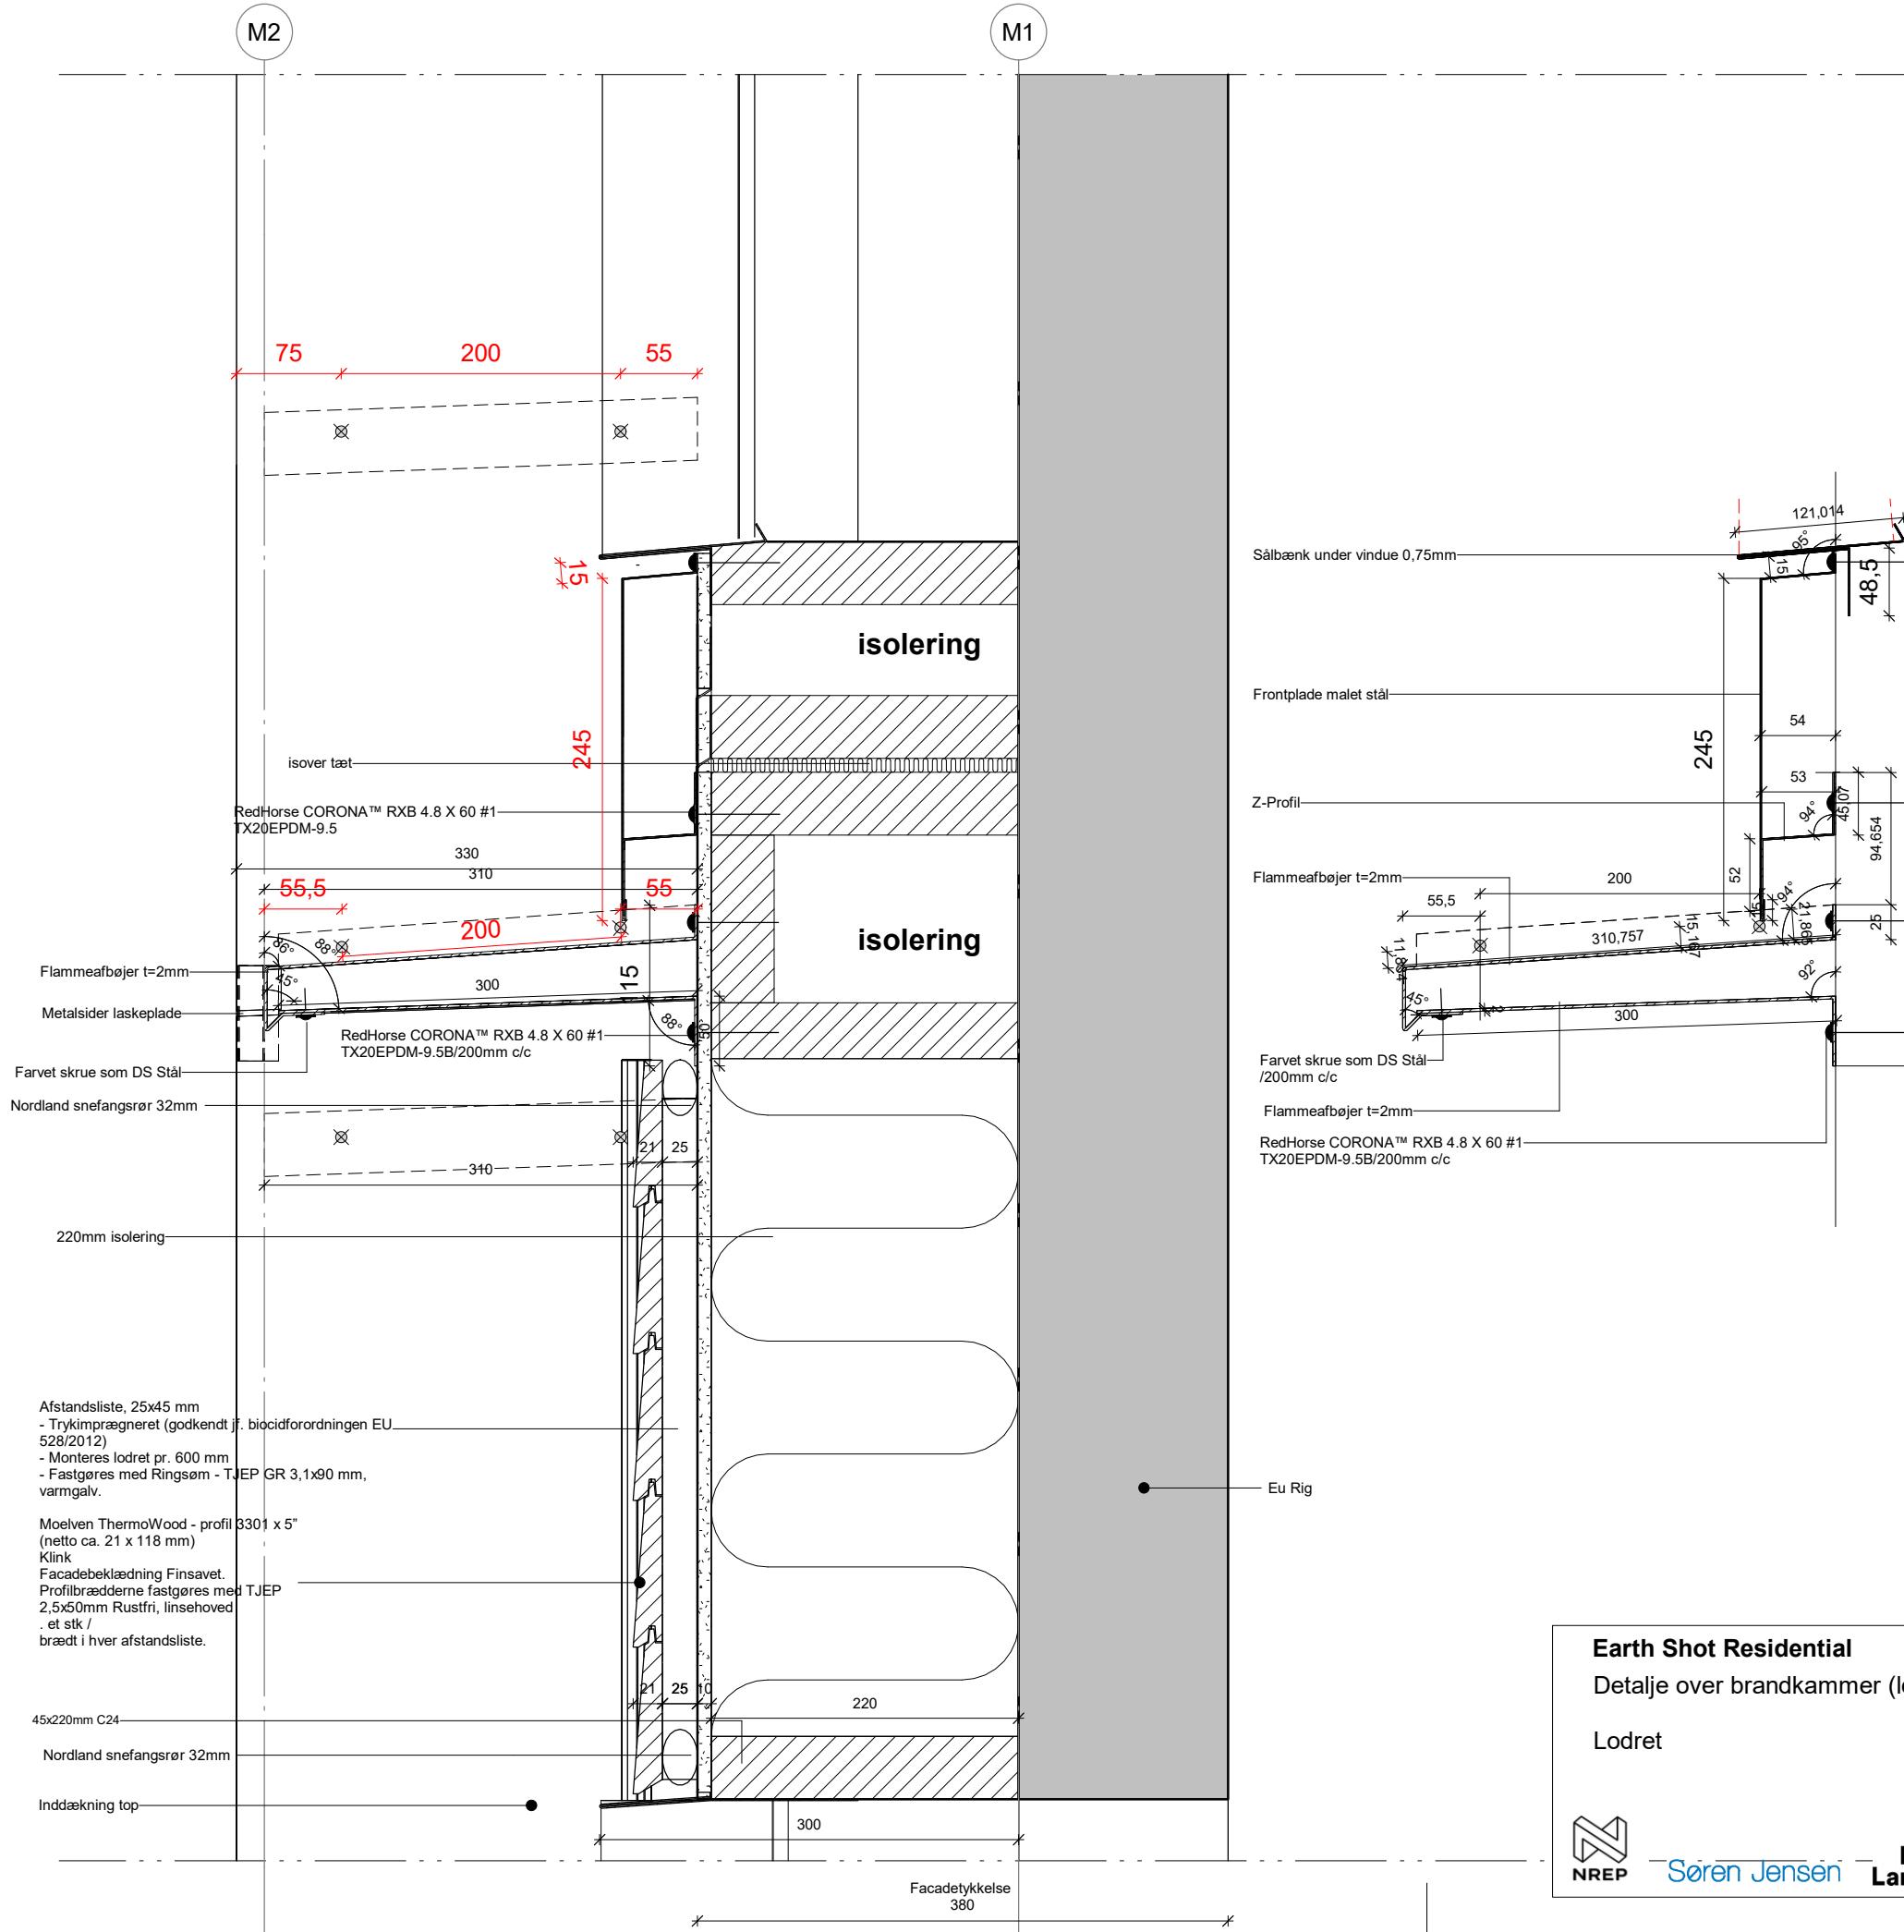

Skruer til fastgrelse af **gips** på træ:
Type: Spil hærdigipsskrue, ELFZ, 4,2 x 42mm must be used when fixing in wood.
skruer med kantafstand 10-15mm max. 300mm c/c afstand maks. c/c stolpeafstand 600mm

TAPE TIL VINDGIPS
Paroc XST 042 Cortex B-Tape, 60mm, sort
