

TEST REPORT NON-LOADBEARING WALL

Name of sponsor:	Wood:UpHigh		
Product name:	Non loadbering wall		
File no.:	PGA12343A	Revision no.:	1
Test date:	2023-09-18	Date:	15-02-2024
Pages:	11	Encl.:	67
Ref:	MMN	/	CHB

Client information

Client: Wood:UpHigh

Address: Jernholmen 12
2650 Hvidovre
Denmark

The test is part of the project Wood:UpHigh. The project is partly sponsored by Uddannelses- og Forskningsstyrelsen through DBI's performance contract, Realdania and Grundejernes Investeringsfond. The project is headed by DBI, except for the construction of test specimens for the fire tests, which is headed by LOGIK&CO.

The results relate only to the items tested. The report should only be reproduced in extenso - in extracts only with a written agreement with this institute.

Date of test

The test was conducted on 18-09-2023.

Purpose of test

Examination of the fire-resistance of two non-loadbearing walls.

The purpose of this test was to determine if there was a difference between using retention of the insulation inside the wall or not. The test was established by comparing two walls with and without retention. Each wall consisted of two types of wood insulation to observe the reaction of the insulation. The insulation in each wall was blown-in and batts.

The test specimen has been subjected to a standard fire test in following the principles standards:

EN 1363-1:2020 Fire resistance tests – General requirements

in conjunction with:

EN 1364-1:2015 Fire resistance tests for non-loadbearing elements Part 1: Walls

Test specimen

The trade name and sponsors identification mark are stated below:

Trade name:	Wood:UpHigh
Identification mark:	None

The components for the test specimen were delivered and mounted by the sponsor.

Drawings and description

Details of the construction are shown in the enclosed documentation as stated below:

Type	Drawing No.	Dated	Subject
Drawing	1.0	18-09-2023	Comparison test of retention of insulation
Drawing	1.1	18-09-2023	Comparison test of retention of insulation
Drawing	1.2	18-09-2023	Comparison test of retention of insulation

The documentation is supplied by the sponsor, and it is stamped by DBI - Danish Institute of Fire and Security Technology

Description

The test specimen consisted of the components described in the following. DBI inspected the components during mounting, the test and after the test.

The sponsor carried out the selection of the products for the test specimen as well as the mounting.

Test specimen A+B

External measures: Height: 3100 mm Width: 2550 mm Thickness: 120 mm

The specimen consisted of 2 types of walls. Wall-A and Wall-B

The specimen is a non-loadbearing wall.

The wall is a wood stud wall with 2 types of wood-based insulation. The outer layer of the wall consisted of gypsum boards.

Difference between the walls:

Wall-A had retention to hold the insulation.

Wall B had no retention.

The test specimen was symmetrical.

All measurements are written in by (Width x Length x thickness)

Wooden frame

Top and bottom rails: The top and bottom beams are 45 x 95 mm dry graded C24 construction spruce wood with a nominal density of 450 kg/m³. The top and bottom beams are fixed to each end of the studs.

Wood studs: A total of 14 studs were used in the wall construction, all 2910 mm tall. The studs are 45 x 95 mm dry graded C24 construction spruce wood with a nominal density of 450 kg/m³. The studs were spaced c/c 450 mm.

Fixation: 5,9 x 35 mm [REDACTED] screws. Used on the top and bottom of the studs 301 mm from frame with c/c 450 mm.

Insulation

- Insulation:** The insulation material used was a wood insulation designated [REDACTED] with a nominal thickness of 95 mm and nominal density of 40 kg/m³. The tested slab size was 570 x 1000 x 95 mm (width x length x thickness). The insulation was placed in layers between the wood studs.
- Loose insulation:** The blow-in insulation material used was a loose wood insulation designated [REDACTED] [REDACTED] blown into the construction with a measured density of 60 kg/m³.
- Retention:** 2 mm steel wire fastened on each side of the wall. Steel wire was holding the insulation on wall-A. The distance between the wires in the vertical direction was 200 mm. Wall A consisted of approximately 15 rows of steel wire, on each side.
- Fixings:** 10 mm [REDACTED] galvanized staples were used to mount the steel wire to the frame and the studs. There was used 2 staples on each wooden stud, for each row of steel wire. 18 mm Tjep klammer staples were used to mount the steel wire to the frame and the studs. There was used 1 staple on each wooden stud, for each row of steel wire, few millimeters from the two rapid galvanized staples.

Outer layers

- Outer boards:** 900 x 2400 x 12.5 mm [REDACTED]. These gypsum boards are fastened on each side of the wall, on the studs. There were drilled holes in the gypsum boards with a diameter of 100 mm, to blow the loose insulation in the construction.
- Inner boards:** 60 x 125 x 12.7 mm plywood was used to close the holes made in the gypsum boards. They were screwed in behind the gypsum boards, so a small round board of gypsum could be fastened to it.
- Fixings:** 3.9 x 35 mm [REDACTED] gypsum screws were used to mount the gypsum boards to the studs by cc 155 mm. 3.5 x 41 mm [REDACTED] screws was used to mount the plywood to the gypsum boards. 4 screws were used at each hole.
- Finish:** There was made small round gypsum board pieces to close off after the insulation was blown in. Borup modelgips was used to close the gap left in the holes after the small gypsum board was mounted to the plywood. Droppen allround sandspartel was used as finish after the modelgips was smeared in the holes.

Measured by DBI

Product		Wood batt insulation	Wood Studs	Gypsum boards	Lose wood insulation
Density	kg/m ³	57	484	481	40
Thickness	mm	50.0	45.0	12.5	95.0
Moisture content	%	9.71	7.38	0.45	3.11
Sampling method		Extra material	Extra material	Extra material	Extra material
Drying temperature	°C	105	105	55	105

Test conditions

Conditioning

The test specimen was delivered on the 12-09-2023 to the DBI laboratory and stored under room temperature. On the day of the fire testing the condition of the test specimen was similar with respect to its moisture content as the test specimen would be in normal service.

Mounting

The test specimen was mounted in a wall frame with a clear opening of 5500 x 3100 mm (width x height). The frame was divided in two section with a 300 mm wide aerated concrete element in the middle resulting in two identical openings of 2600 x 3100 mm (width x height).

A free edge was established along one vertical edge of the test specimen (2 x 25 mm stone wool with alu-foil in each side) on both walls to allow for unrestrained deformation of the test specimen on the one side.

Fire test

Observations were made during the test on the general behavior of the test specimen.

Temperature observations were taken continually during the entire testing time.

The surface temperatures were measured on the unexposed surface of the test specimen as indicated on DBI drawing no. 1.3.

The furnace temperature was determined by means of plate thermocouples uniformly distributed at a distance of approximately 100 mm from the exposed side of the test specimen. The furnace temperature was continuously controlled so as to follow the standard time temperature curve within the accuracy specified in EN 1363-1:2020.

The thermocouples were constructed according to the description in EN 1363-1:2020.

Test results

Duration of the test was 49 minutes.

Measurement

The enclosed graphs and tables show:

Enclosures 2.0 and 2.1	Furnace temperatures The actual minimum-, average- and maximum furnace temperature in relation to the standard temperature. The table also shows the area under the actual time-temperature curve as well as the area under the standard time-temperature curve
Enclosures 3.0 and 3.1	Vertical furnace pressure The differential pressure in the furnace during the test, measured 3.3 m above notional floor level
Enclosures 4.0 and 4.1	Ambient temperature The ambient temperature in the laboratory during the test
Enclosures 5.0 and 5.1	Average temperature rise AB Measured with 5 thermocouples
Enclosures 6.0 and 6.1	Maximum temperature rise AB Maximum temperature rise on the unexposed side
Enclosures 7.0 and 7.1	Wall A B - indicative temperature - unexposed gypsum Maximum temperature rise inside the construction
Enclosures 8.0 and 8.1	Wall AB - indicative temperature - center studs Maximum temperature rise inside the construction
Enclosures 9.0 and 9.1	Wall AB - indicative temperature - exposed gypsum Maximum temperature rise inside the construction
Enclosures 10.0 and 10.1	Average temperature rise AL Measured with 5 thermocouples
Enclosures 11.0 and 11.1	Maximum temperature rise AL Maximum temperature rise on the unexposed side
Enclosures 12.0 and 12.1	Wall A L - indicative temperature - unexposed gypsum Maximum temperature rise inside the construction
Enclosures 13.0 and 13.1	Wall AL - indicative temperature - center studs Maximum temperature rise inside the construction
Enclosures 14.0 and 14.1	Wall AL - indicative temperature - exposed gypsum Maximum temperature rise inside the construction
Enclosures 15.0 and 15.1	Average temperature rise BB Measured with 5 thermocouples
Enclosures 16.0 and 16.1	Maximum temperature rise BB Maximum temperature rise on the unexposed side

Enclosures 17.0 and 17.1	Wall BB - indicative temperature - unexposed gypsum Maximum temperature rise inside the construction
Enclosures 18.0 and 18.1	Wall BB - indicative temperature - Center studs Maximum temperature rise inside the construction
Enclosures 19.0 and 19.1	Wall BB - indicative temperature - exposed gypsum Maximum temperature rise inside the construction
Enclosures 20.0 and 20.1	Average temperature rise BL Measured with 5 thermocouples
Enclosures 21.0 and 21.1	Maximum temperature rise BL Maximum temperature rise on the unexposed side
Enclosures 22.0 and 22.1	Wall BL - indicative temperature - unexposed gypsum Maximum temperature rise inside the construction
Enclosures 23.0 and 23.1	Wall BL - indicative temperature - Center studs Maximum temperature rise inside the construction
Enclosures 24.0 and 24.1	Wall BL - indicative temperature - exposed gypsum Maximum temperature rise inside the construction
Enclosures 25.0 and 25.1	Deformation Negative values indicate movement towards the furnace

Visual observations:

Note: see drawing enclosure 1.3 for thermocouple placement reference and naming.

The photographs on the attached photo sheets show the test specimen during the mounting, testing and after the test. See the description at each photo.

Conclusion

Fire resistance testing according to EN 1364-1:2015: of the construction described in this test report showed that failure according to the performance criteria stated in the test method occurred at the following time:

Integrity (E): **49 minutes**

- Sustained flaming did not occur during the test.
- The cotton pad was not ignited during the test.
- No through-going openings in the test specimen were created during the test.

Insulation (I): **49 minutes**

- Failure of insulation did not occur during the test.
- The average temperature rise on the unexposed surface of the test specimen did not exceed 140°C during the test.
- The maximum temperature rise on the unexposed surface of the test specimen did not exceed 180°C during the test.

Remarks

There is no field of direct application of the test results.

This report details the method of construction, the test conditions and the results obtained when the specific element of construction described herein was tested following the procedure outlined in EN 1363-1:2020, and where appropriate EN 1363-2:1999. Any significant deviation with respect to size, constructional details, loads, stresses, edge or end conditions other than those allowed under the field of direct application in the test method is not covered by this report.

Because of the nature of fire resistance testing and the consequent difficulty in quantifying the uncertainty of measurement of fire resistance, it is not possible to provide a stated degree of accuracy of the result.

This report has only been printed in a pdf-version. DBI has not issued a hard copy version.

All values mentioned in this report are nominal values, production tolerances are not considered.

The test was not performed accredited.

Unexposed side

Exposed side

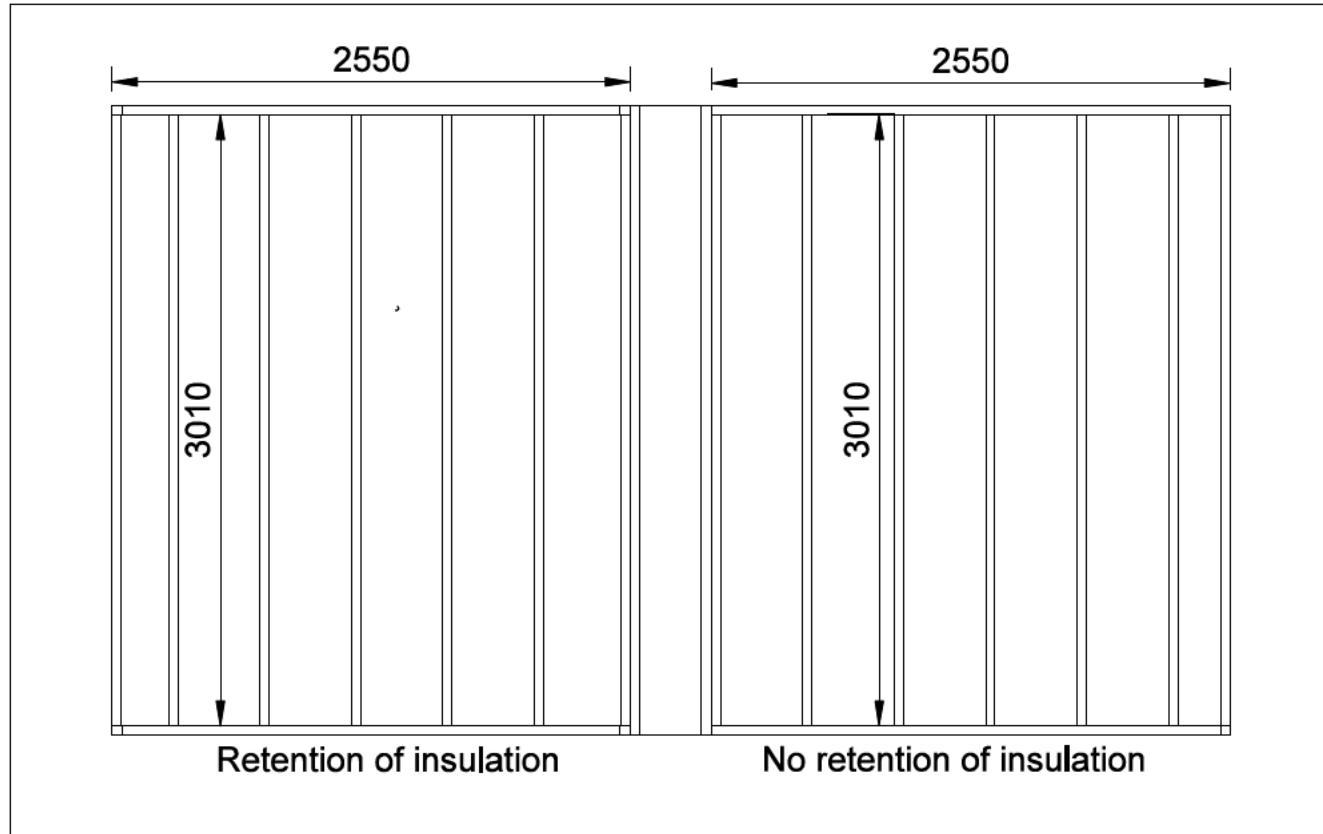

All measurements are in mm

Danish Institute of Fire and Security Technology
Sponsor: Wood:UpHigh
Subject: Comparison test of retention of insulation

File No.: PGA12343A
Test date: 18-09-2023
Enclosure: 1.0

Unexposed side

The 3 fields closest to the fixed edge are with batt insulation. The 3 fields closest to the free edge is with loose fill insulation.

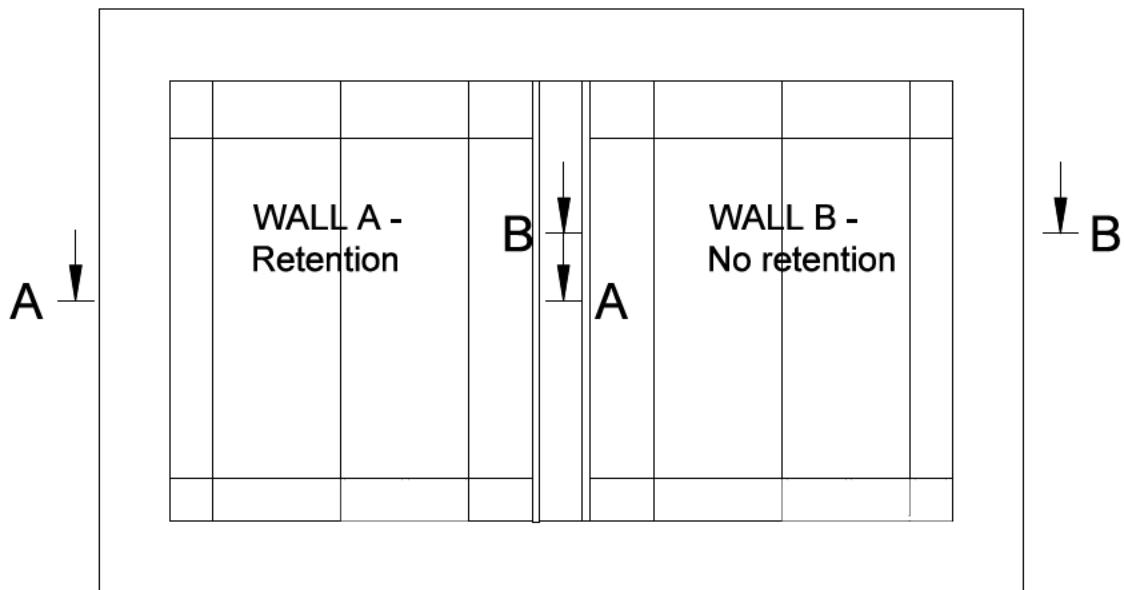

Retention of insulation happens with a 2 mm thick steel wire per 200 mm both on the exposed and unexposed side. The steel wire is stapled to the wood studs.

The 3 fields closest to the fixed edge are with batt insulation. The 3 fields closest to the free edge is with loose fill insulation.

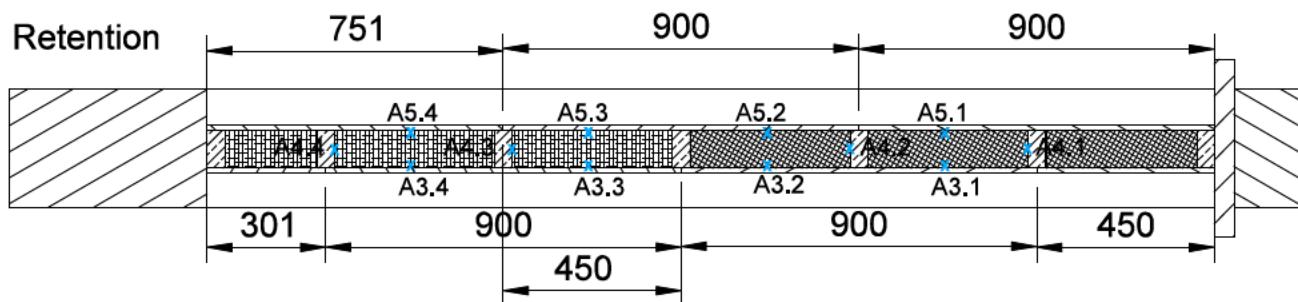

No retention of insulation.

All measurements are in mm

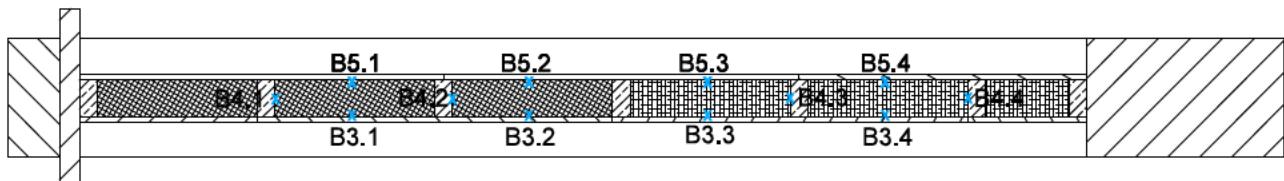

A-A (1:18)

B-B (1:18)

Thermocouples shall be placed at mid height of the construction

No retention

All measurements are in mm
